# Instructions:

Step 1: Go to your Udemy course and open your Notes. Make sure you have them in your preferred sorting order (most logical is <mark>All lectures</mark> and <mark>Sort by oldest</mark>).
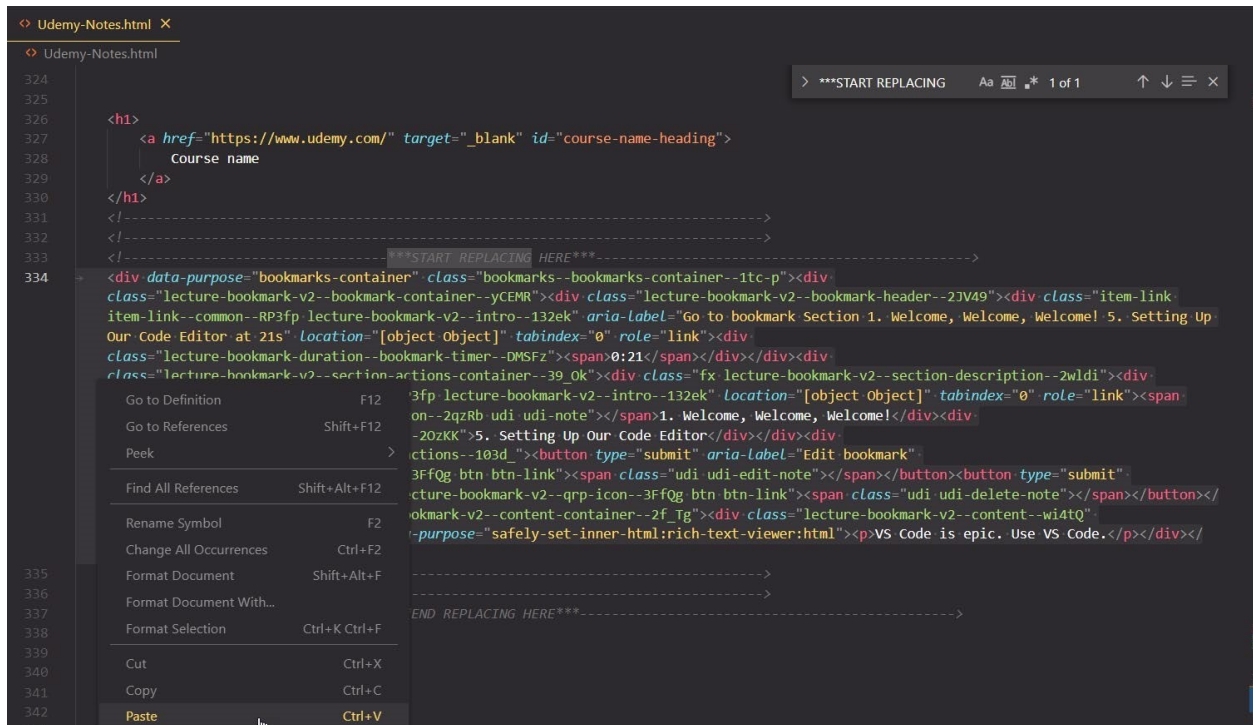

Step 2: Open the browser developer tools and search for the `<div>` with the attribute `data-purpose="bookmarks--container"`. You can search for it quickly by hitting Ctrl+F (Windows) or Cmd+F (Mac) and searching for "bookmarks--container".

Step 3: Right-click on the `<div>`, select "Copy", and select "Copy outerHTML". This will copy both the `<div>` and all its children. See image demonstration below.

<mark>(scroll down to see rest of instructions)</mark>

Step 4: Open my provided HTML file in a code-editor. Search for the portion labelled

START REPLACING HERE and ending with ***END REPLACING HERE***. Delete the example code currently there and replace it with what we copied in **Step 3**. See the image demonstration below:

Step 5 (optional): Above the section where you replaced the code, I added an `<h1>` with an `<a>` tag. Change the contents to the title of the Udemy course and the link to the course page if you want (by default, it just says "Course name" and links to the Udemy homepage). Also, you should probably change the `<title>` to the course name (by default, it says "Course name | Udemy").

Step 6. That's it; you're done. Open the HTML file in your browser and your notes will be there, styled just like they are on Udemy thanks to the style.css file I created. You've successfully stored your Udemy notes :)
